

## Asphalt Materials

**Danny Gierhart, P.E.**  
**Asphalt Institute Regional Engineer**  
**Tuttle, Oklahoma**

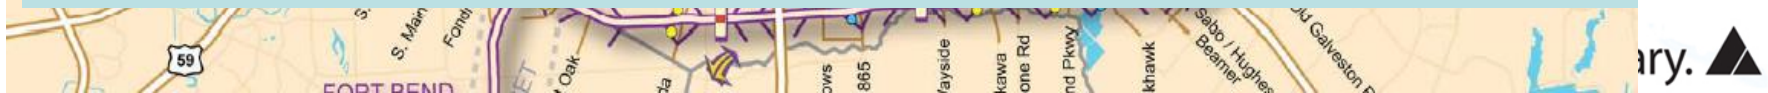

# Project Location

**Project Length = 5 miles**  
**Project Cost - \$4.1 M**  
**19,600 tons**  
**Constructed over 4 weekends April-May 2009**

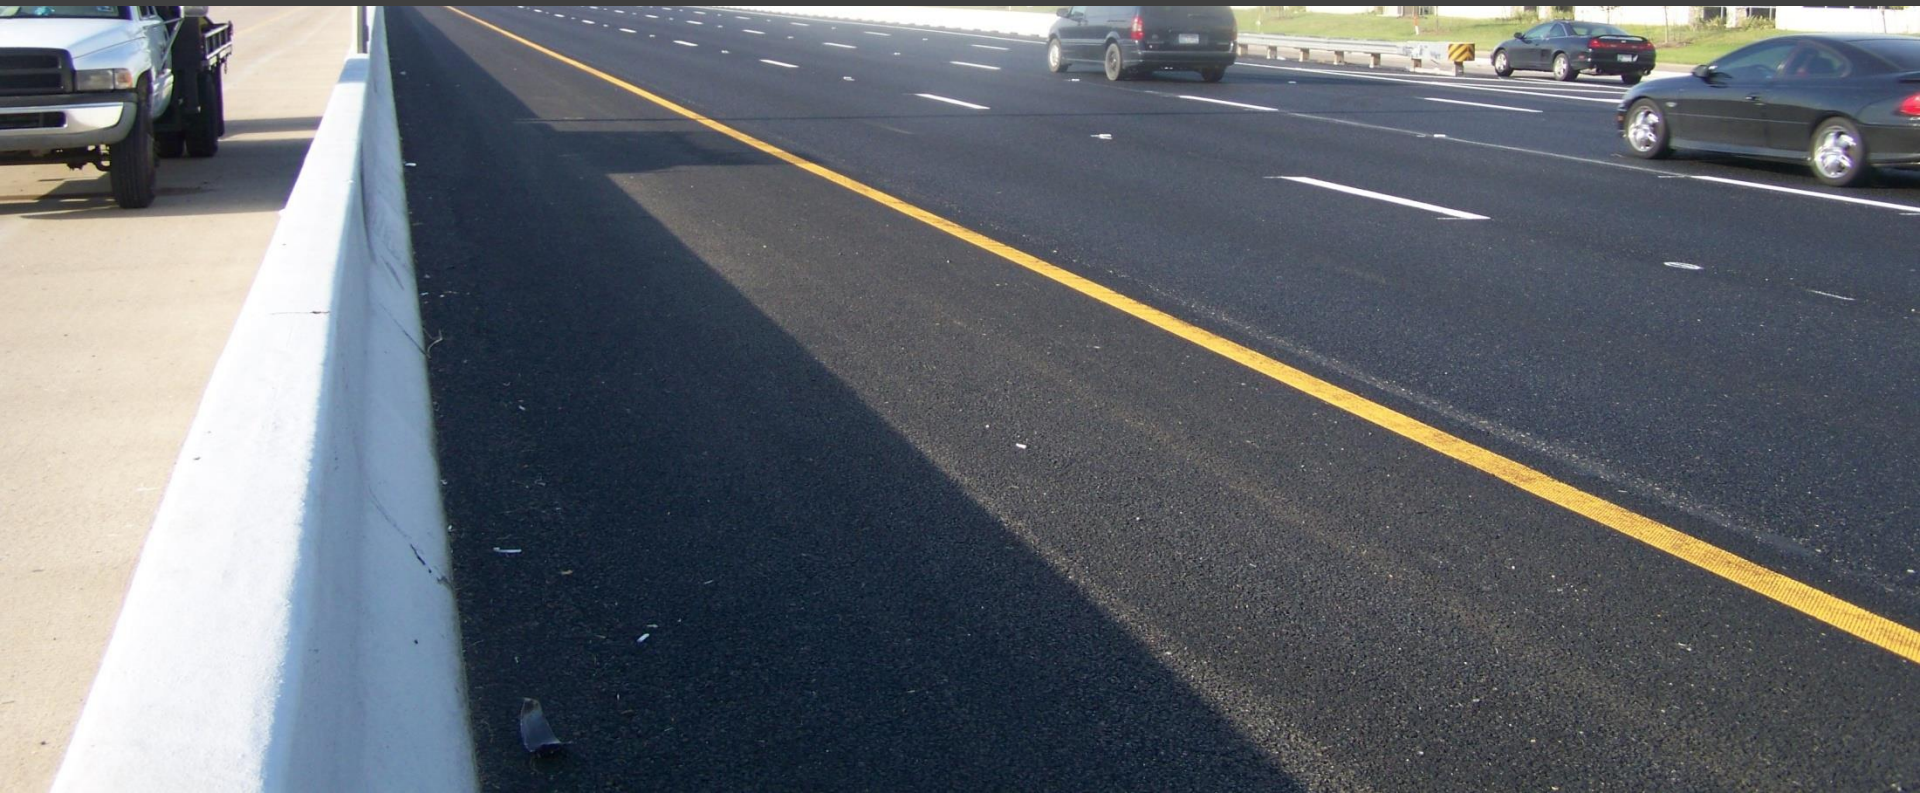

**Project area had seen over 100 accidents in the previous two years, many in wet weather**

**Solution: Asphalt Permeable Friction Course**

**HCTRA Engineer Quinton Alberto reported that they have been pleasantly surprised with:**

- **the ease of construction**
- **the short time to complete the project**
- **the aesthetically pleasing appearance of the project**
- **the performance in rain**
- **the quieter road noise**

# Performed a quick and easy noise study this morning (July 10, 2013)

**Digital Sound Level Meter**  
***Radio Shack - \$49.99***

# Monitored PC Concrete section over a 5-minute period and recorded minimum and maximum readings

**Min – 85 dB**  
**Max – 96 dB**

**Digital Sound Level Meter**  
**Radio Shack - \$49.99**

# Monitored Asphalt PFC overlay section over a 5-minute period and recorded minimum and maximum readings

**Min – 78 dB**  
**Max – 90 dB**  
**min 7 dB lower**  
**max 6 dB lower**

**Digital Sound Level Meter**  
***Radio Shack - \$49.99***

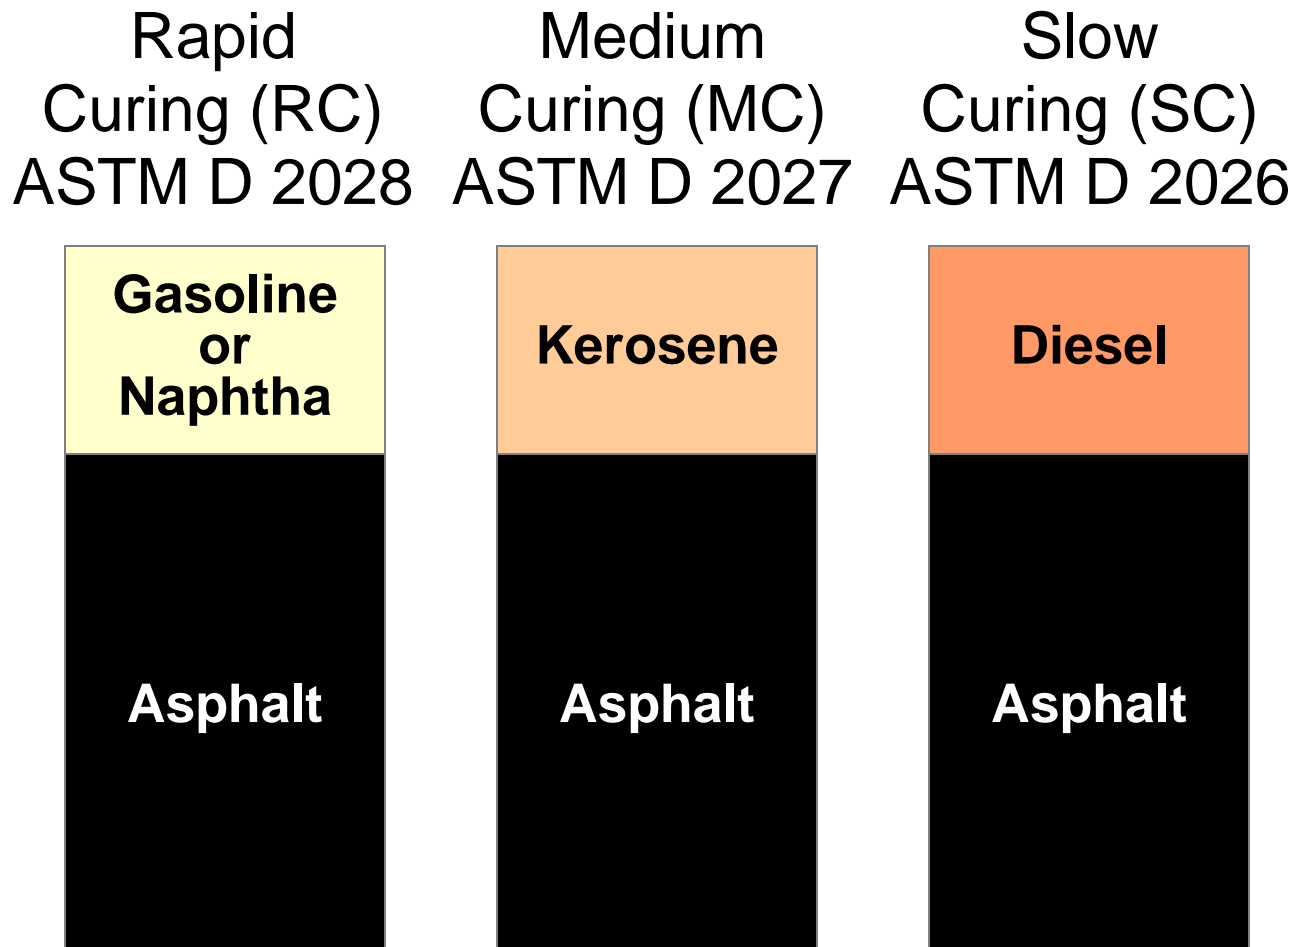

OSHA Daily Permissible Noise Level Exposure	
Hours per day	Sound level
8	90dB
6	92dB
4	95dB
3	97dB
2	100dB
1.5	102dB
1	105dB
.5	110dB
.25 or less	115dB

# Classifications of Asphalt

- **Cutbacks**
- **Emulsions**
- **Asphalt Cement (Binder)**

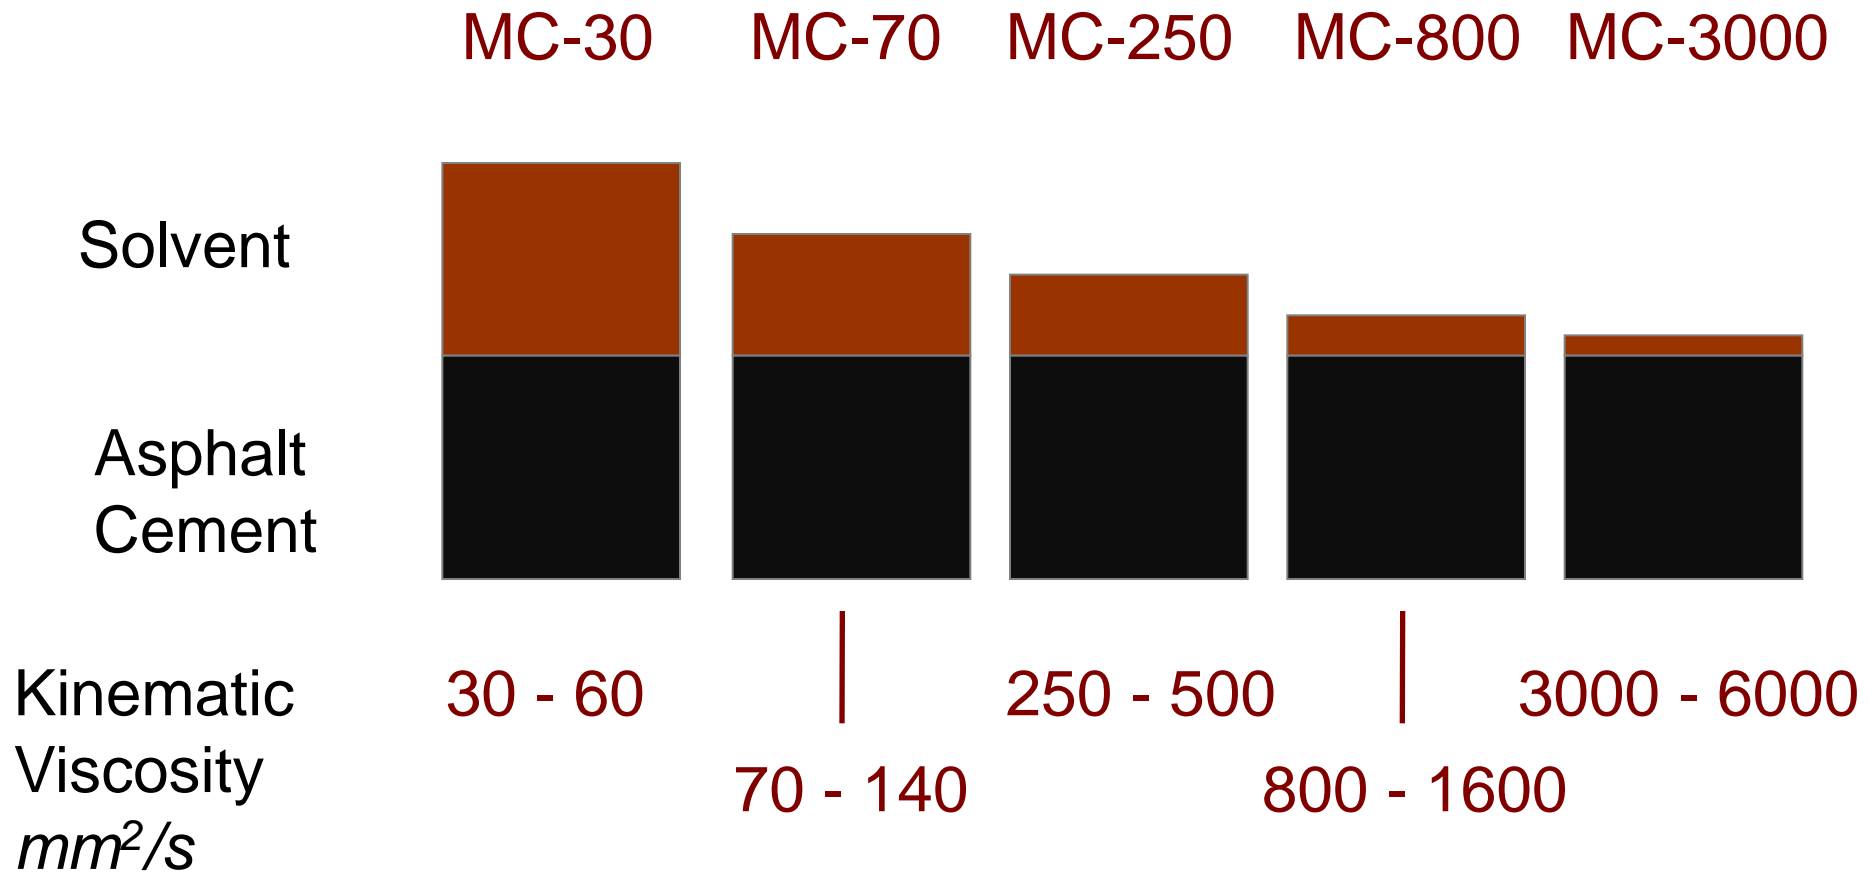

- Paving asphalt liquefied by blending with petroleum solvents
- Resulting material can be sprayed/mixed at lower temperatures
- Primary uses:
  - penetrating prime coat
  - binders for storable cold mix asphalt

# Types of Cutback Asphalt

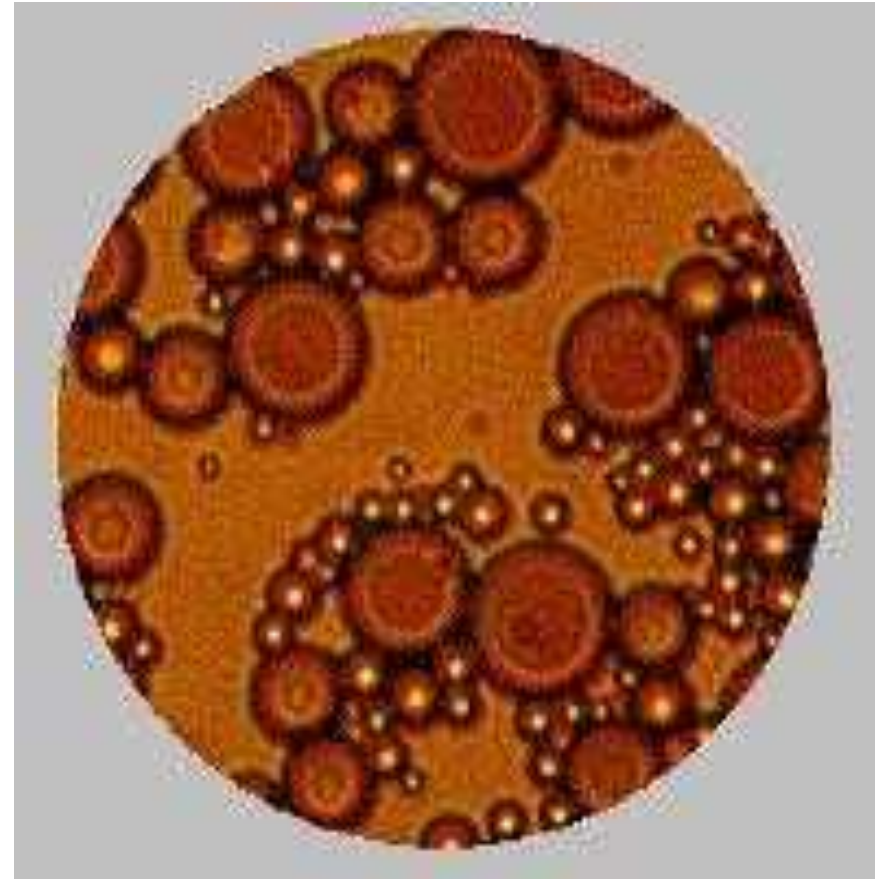

# Grades of Cutback Asphalt

**asphalt** | institute

# Asphalt Emulsions

- Microscopic asphalt droplets suspended in water.
- Mostly 1-5  $\mu\text{m}$  diameter
- Emulsifiers or surfactants hold these droplets in suspension.

# Asphalt Emulsions

The purpose of diluting the binder with water is to lower the viscosity.

This allows the emulsion to be shot onto the roadway surface at much lower temperatures than straight binder.

If the emulsifying agent causes the particles to bear a negative charge, the emulsion is said to be *anionic*.

If the emulsifying agent causes the particles to bear a positive charge, the emulsion is said to be *cationic*.

# Asphalt Emulsions

The process in which the binder globules begin to coalesce and the water evaporates is called *breaking*.

The amount of binder left after the water evaporates is called the *residual asphalt*.

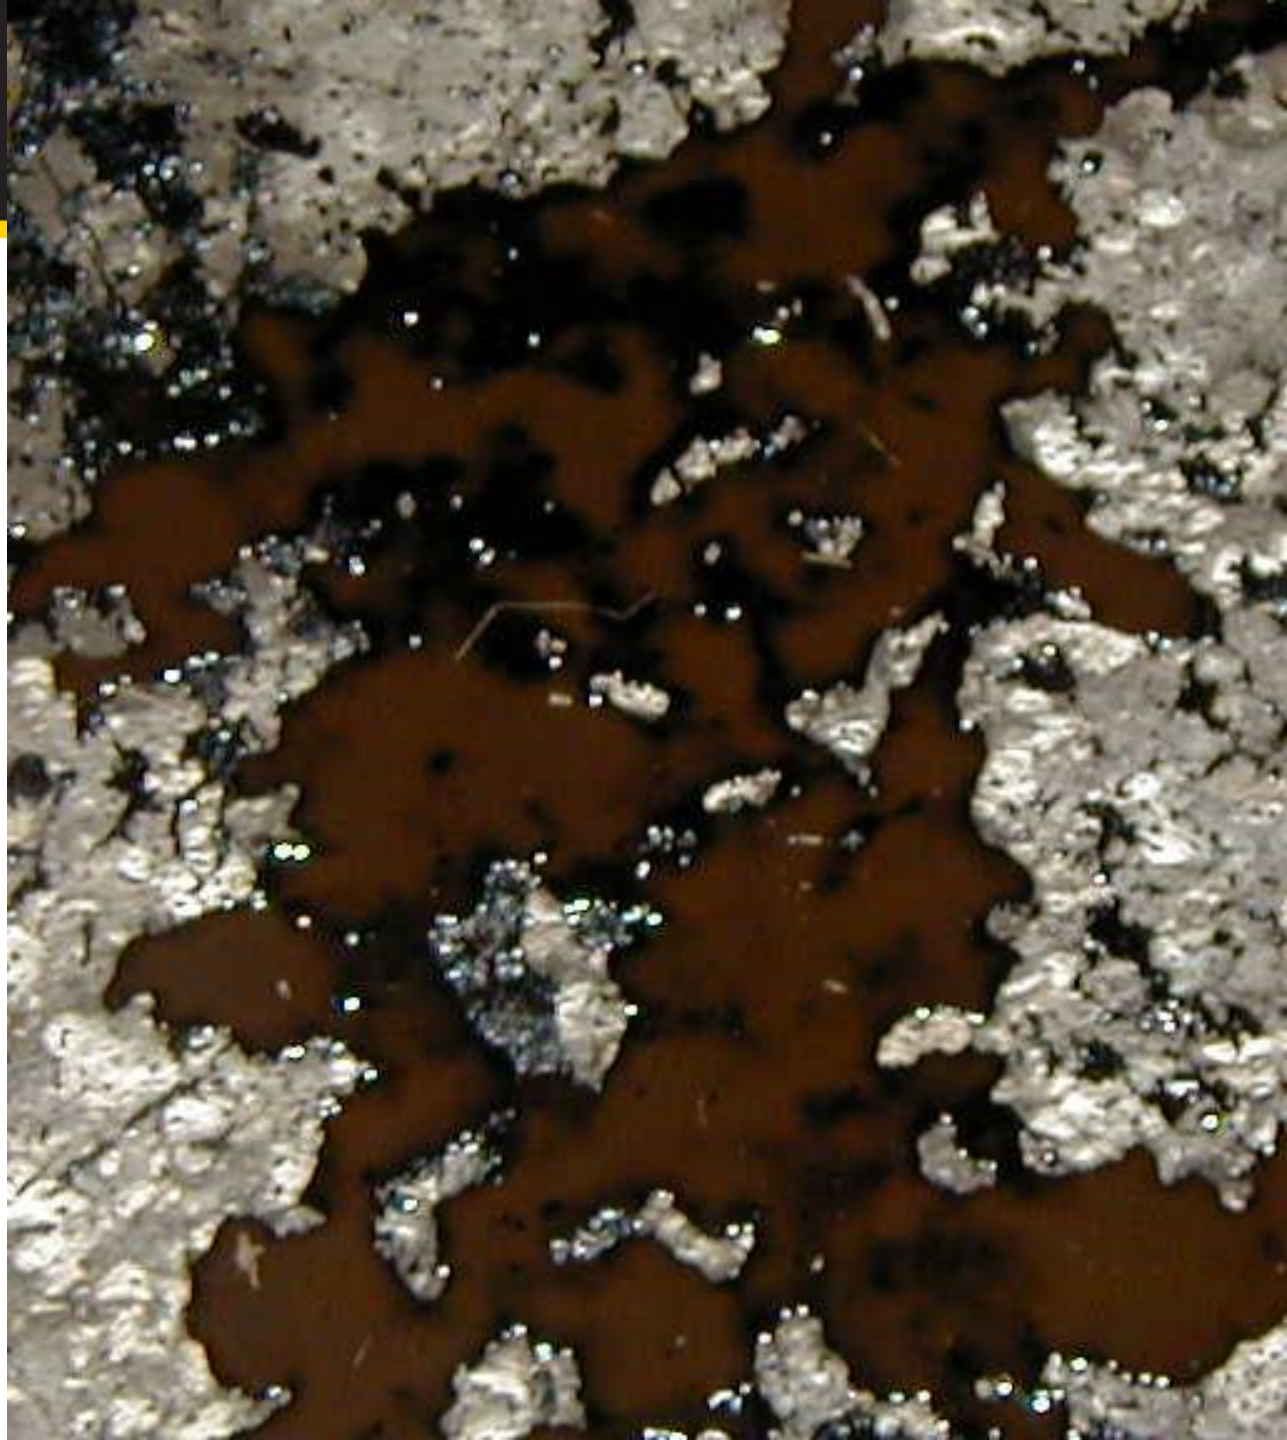

The residual asphalt is expressed as a percentage of the emulsion.

Both the amount and type of water and emulsifying agent mixed with the binder affect the evaporation rate.

# Emulsion

**“Un-broken”  
emulsion  
is brown**

**“Broken”  
emulsion  
is black**

# Negatively- Charged Emulsions are classified into 3 types

**RS (Rapid Setting)**

**MS (Medium Setting)**

**SS (Slow Setting)**

# Positively- Charged Emulsions are also classified into 3 types

**CRS (Rapid Setting)**

**CMS (Medium Setting)**

**CSS (Slow Setting)**

# Additional Nomenclature

**QS = Quick Set**

**HF = High Float**

**1 = Binder residue = 60% Minimum**

**2 = Binder Residue = 65% Minimum**

**h = Hard Pen Asphalt Base**

**s = Soft Pen Asphalt Base or sometimes  
Solvent**

**l and/or p = Latex and/or Polymer**

# Asphalt Emulsions

**Anionic emulsions  
(negatively charged)  
typically bond best with  
positively charged  
aggregates (limestones,  
dolomites).**

**Cationic emulsions  
(positively charged)  
typically bond best with  
negatively charged  
aggregates (granites,  
sandstones).**

# Asphalt Emulsions

**Emulsions are further separated into different grades depending on various factors including viscosity, base asphalt type, and amount of residual asphalt .**

***The most common uses of emulsions are for chip seals, tack coats, and fog seals.***

# Asphalt Binders

The term “binder” covers both neat (unmodified) and modified asphalt cements, but doesn’t include emulsions and cutbacks.

Binders are the “glue” that holds the aggregate together in HMA.

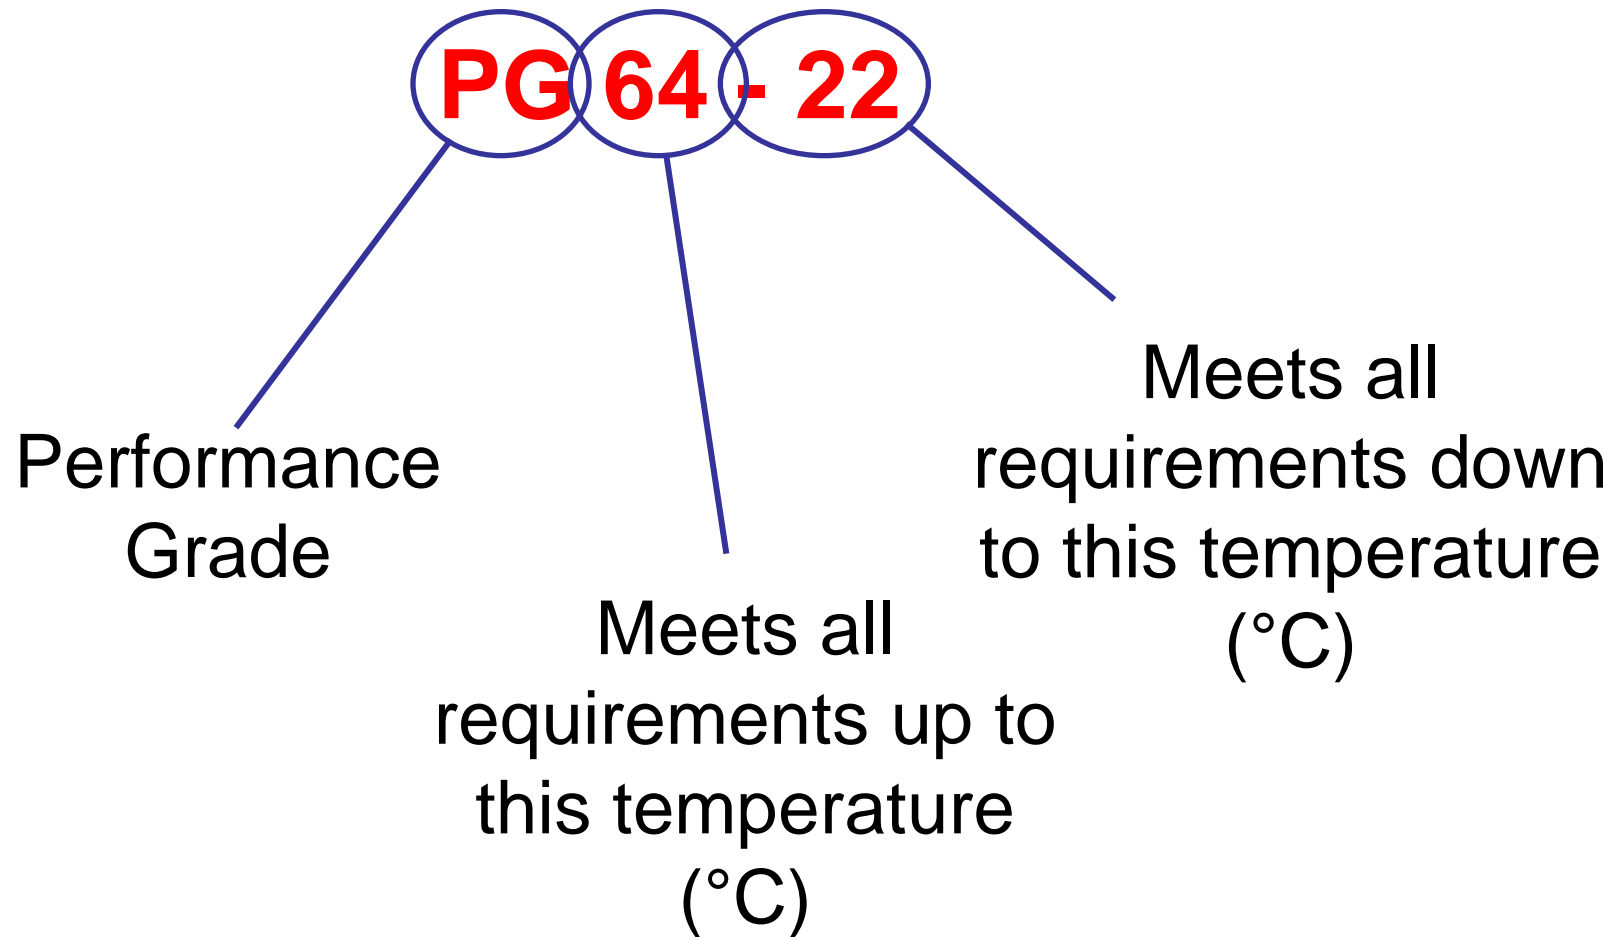

Unlike emulsions and cutbacks, binders are typically required to be heated to over 300°F for use, unless modified for use as Warm Mix Asphalt (WMA).

Polymers can be added to the binder to enhance their high temperature performance.

PG 70-28 Probably Modified

# Asphalt Description and Sources

**asphalt** institute

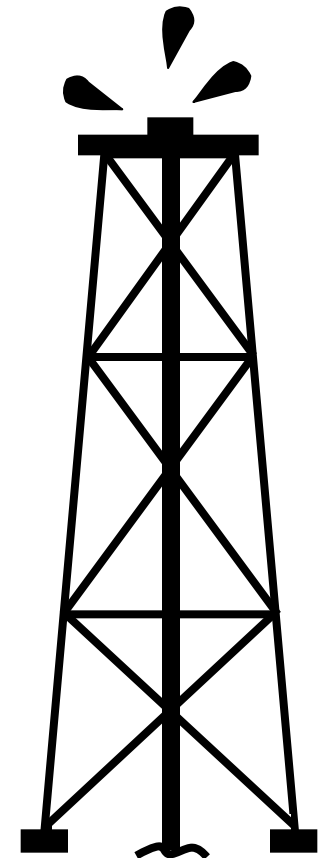

## Asphalt Cement or Asphalt Binder

- Black, cementitious, waterproof material
- Originally mined from a natural lake (still operating today: Lake Asphalt of Trinidad and Tobago)
- Most asphalt today comes from the refining process

# Not All Crudes Are The Same

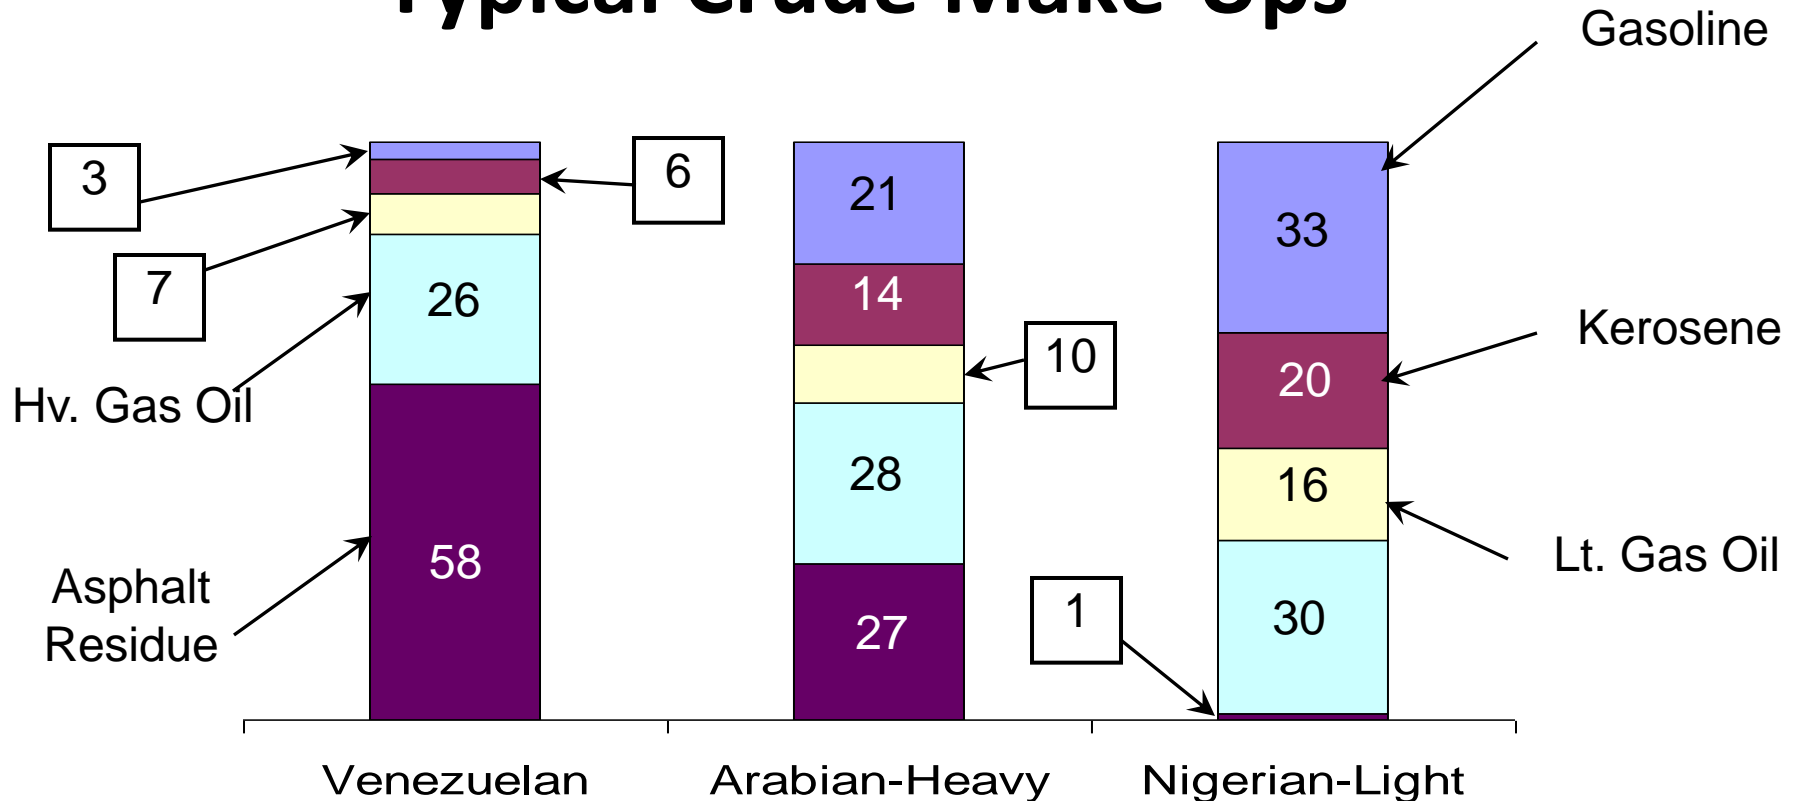

- **Source**
  - Continents, Countries, States, Fields
  - Blends
- **Viscosity**
  - Heavy, Medium, & Light
- **Asphaltenes**
  - Content, Size, Polarity
- **Sulfur**
  - Sweet, sour

# Not All Crudes Are The Same

asphalt institute

## Typical Crude Make-Ups

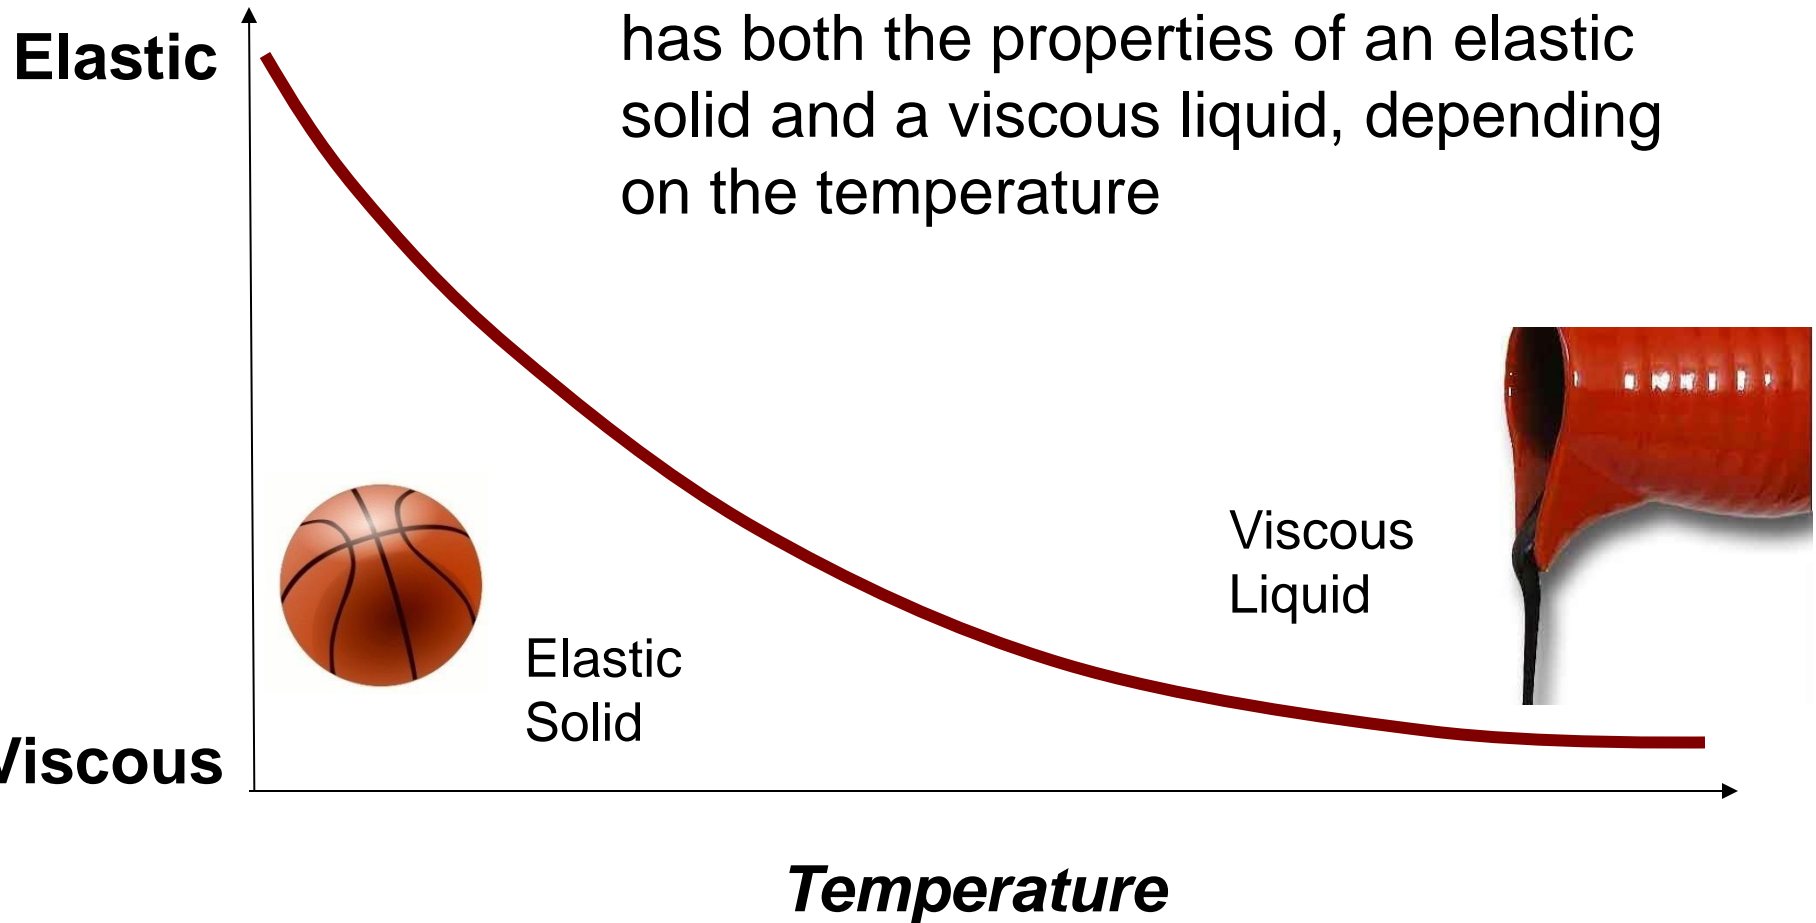

# Asphalt Behavior Depends On:

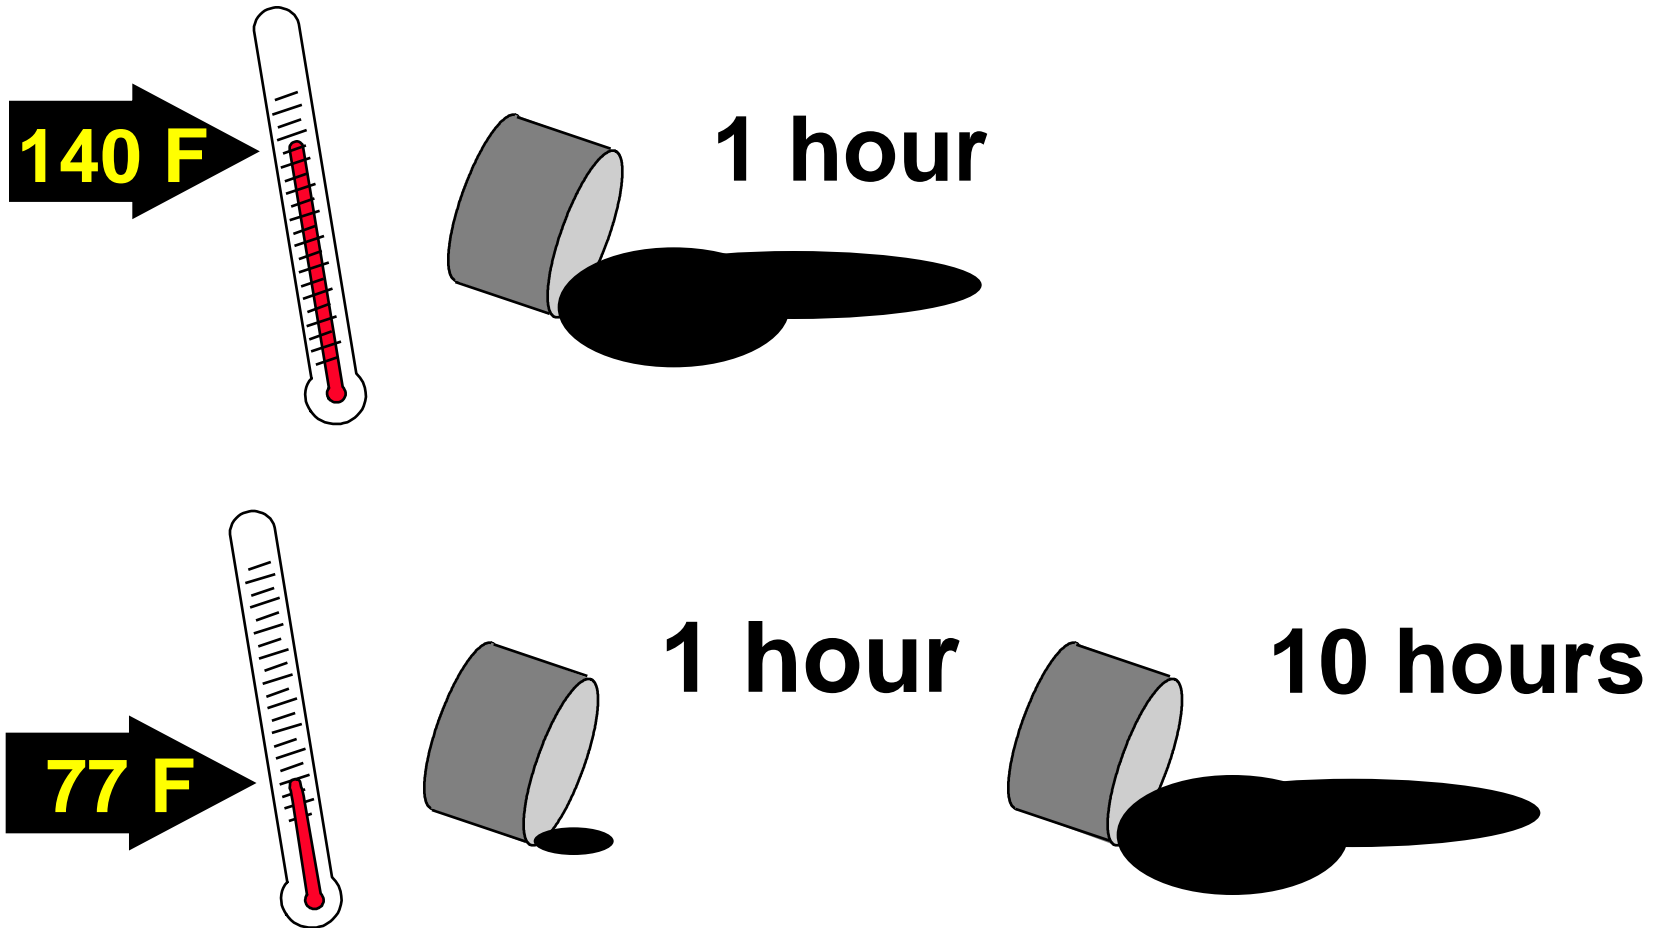

- **Temperature**
- **Time of Loading**
- **Aging (properties change with time)**

# Asphalt Behavior at Varying Temperatures

Asphalt is a *viscoelastic* material that has both the properties of an elastic solid and a viscous liquid, depending on the temperature

# Asphalt Flow Behavior

# Time of Loading

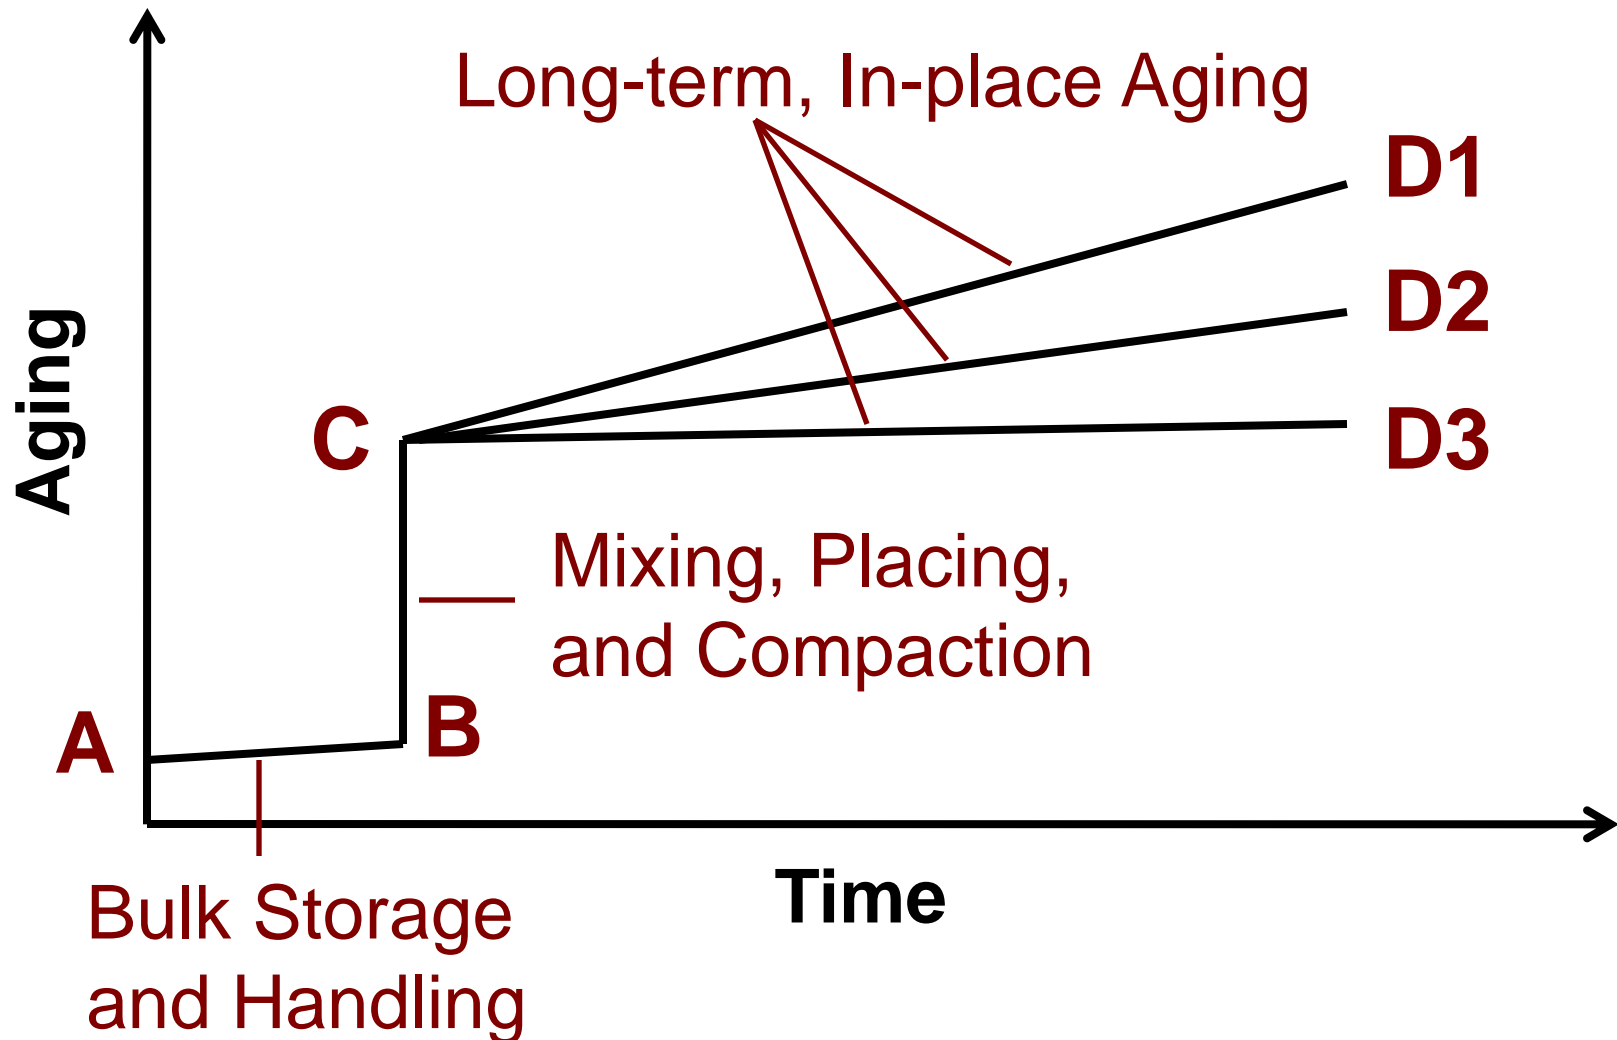

**asphalt** institute

**Training**, so necessary. ▲

# Asphalt aging over the pavement life

asphalt institute

# High Temperature Behavior

asphalt institute

- **High in-service temperature**
  - Desert climates
  - Summer temperatures
- **Sustained loads**
  - Slow moving trucks
  - Intersections

*Viscous Liquid*

# Low Temperature Behavior

**asphalt** | institute

- **Low Temperature**
  - Cold climates
  - Winter
- **Rapid Loads**
  - Fast moving trucks

*Elastic Solid*

# **“Ideal” Asphalt Binder**

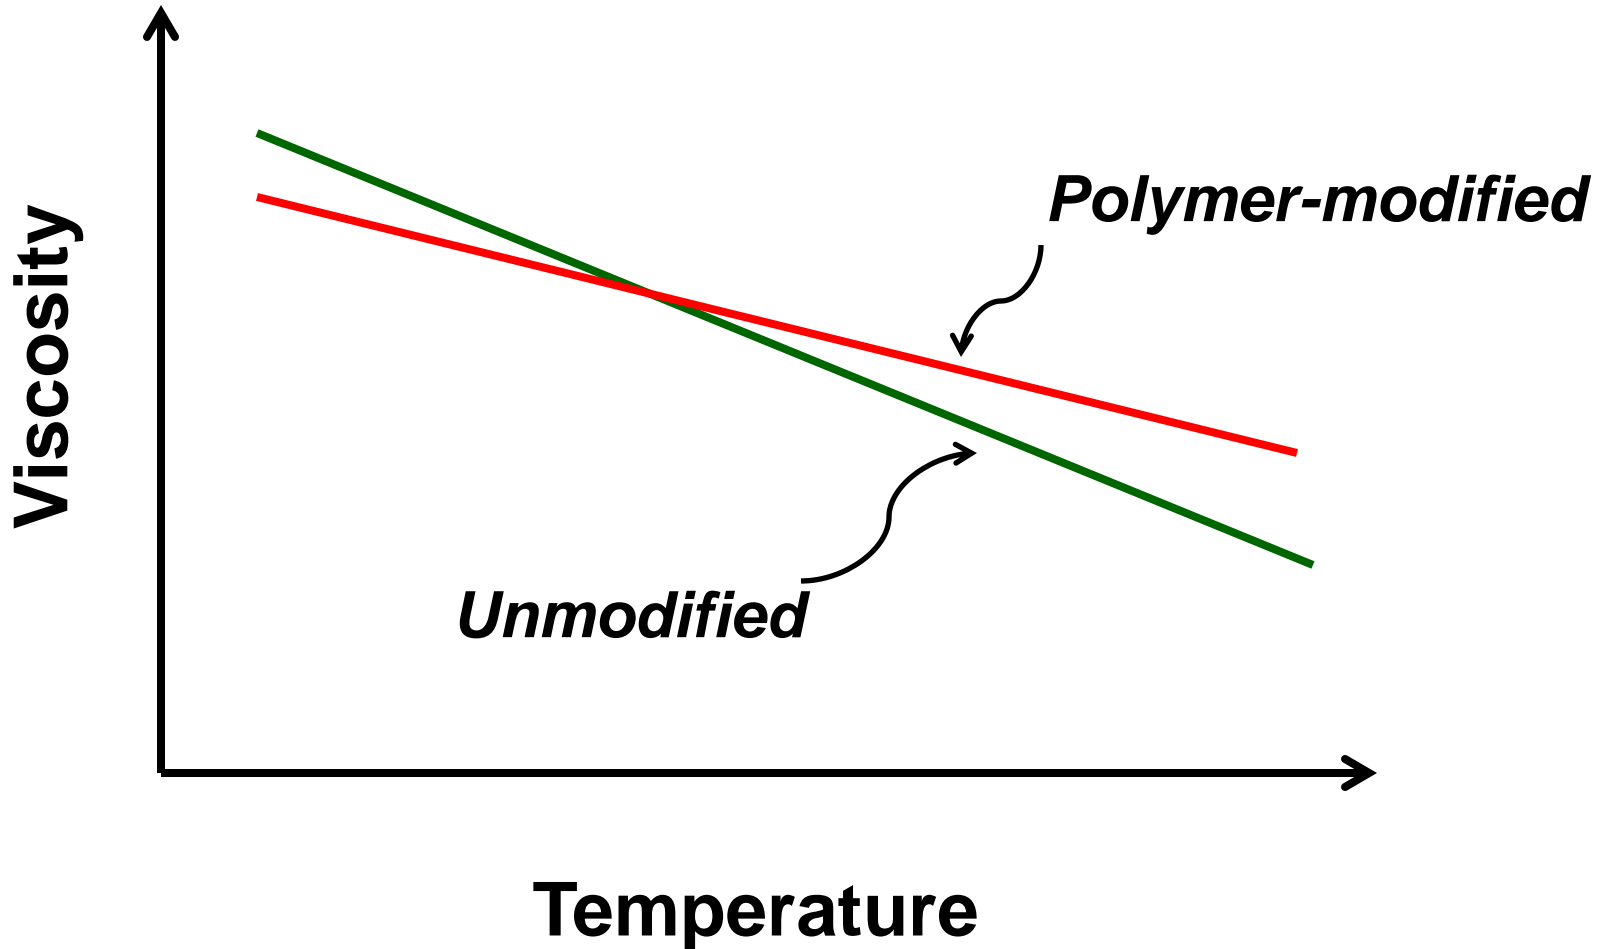

**asphalt** | institute

- **Low stiffness at construction temperature**
- **High stiffness at high in-service temperature**
- **Low stiffness at low in-service temperature**
- **Excellent long-term durability**

# Polymer-modified Asphalt Binder

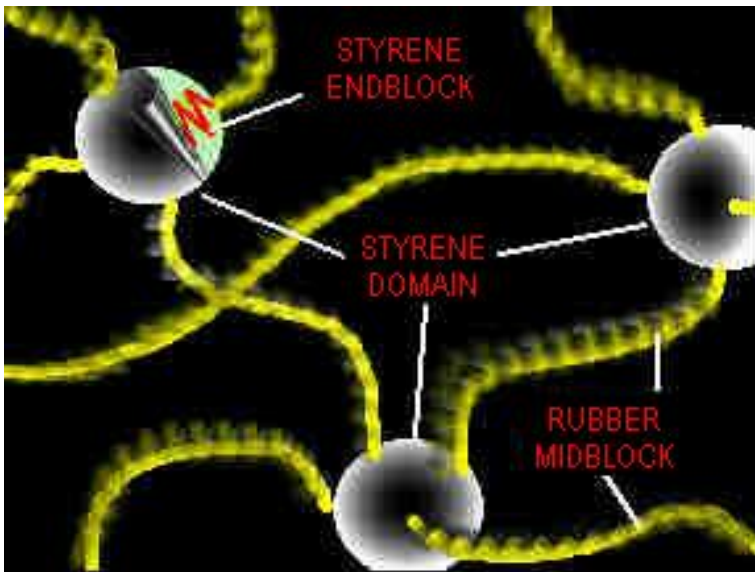

asphalt institute

## General Performance

# Polymers

- Elastomers
- Plastomers
- Combinations

poly • mer

“many parts”

# Elastomers

- Natural Latex Rubber
- Synthetic Latex
  - Styrene-butadiene (SB)
- Block Copolymer
  - Styrene-butadiene-styrene (SBS)
- Reclaimed Rubber

Image courtesy Injectec.com

# Plastomers

- Polyethylene
- Polypropylene
- Ethyl-vinyl-acetate (EVA)
- Polyvinyl-chloride (PVC)

**EVA is a plastic that is used to create stiffer insoles for your shoes**

# Quantifying the Effects of PMA for Reducing Pavement Distress

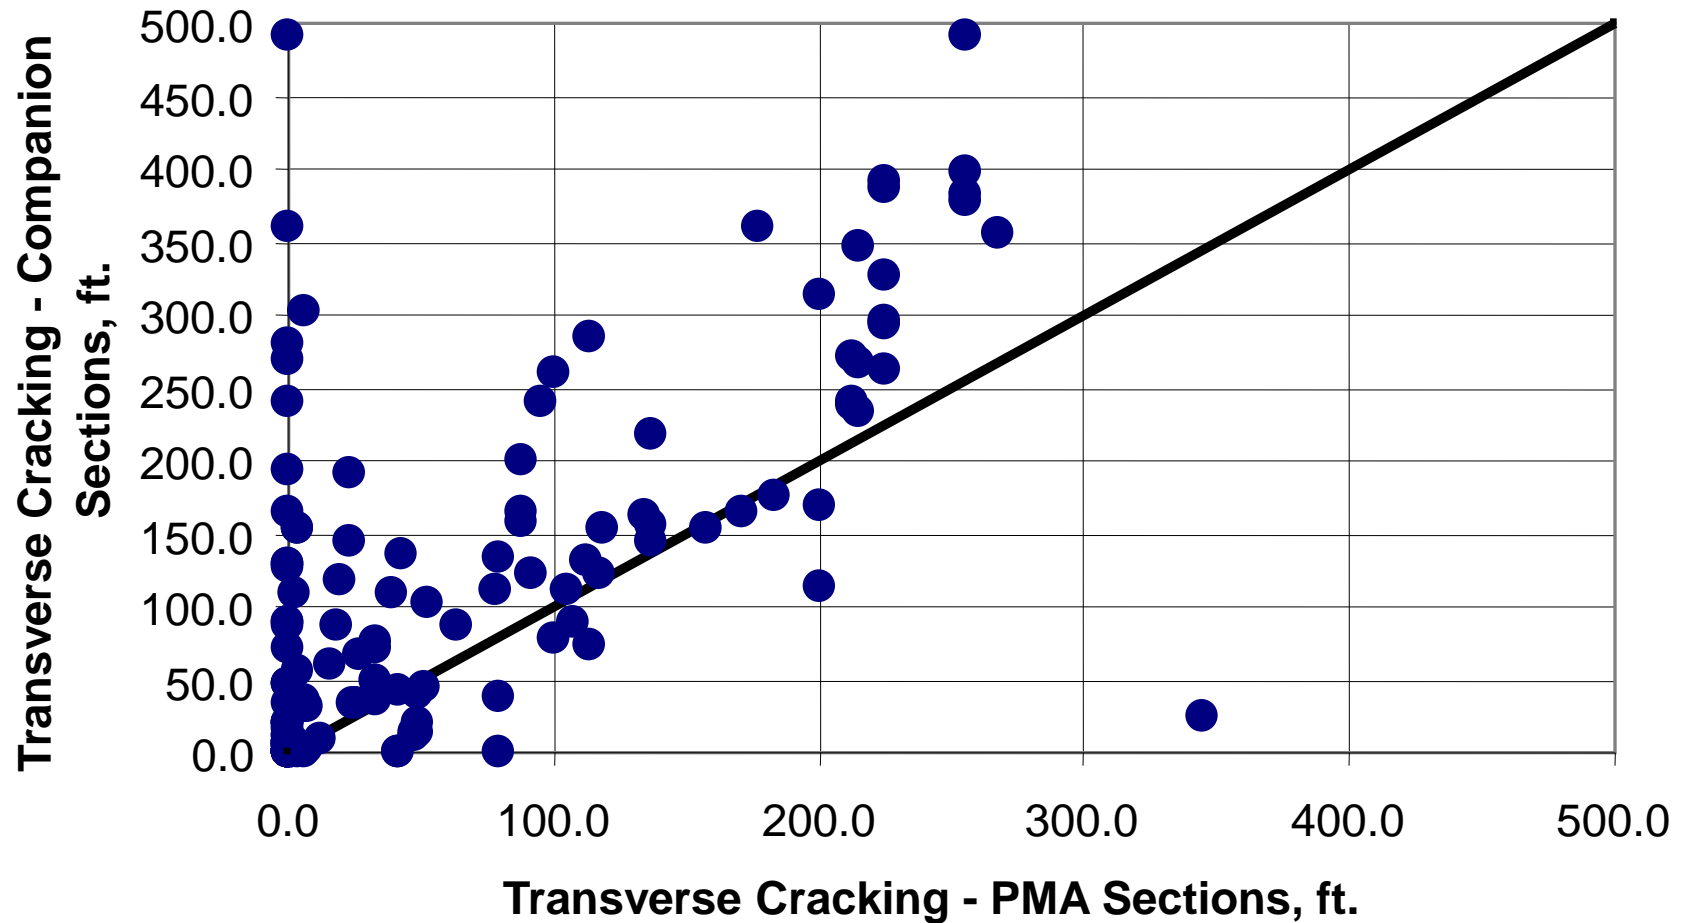

This study (published in Feb 2005) used national field data to determine enhanced service life of pavements containing polymer modified binders versus conventional binders. The data is from a variety of climates and traffic volumes within North America.

# Direct Comparisons – Rutting

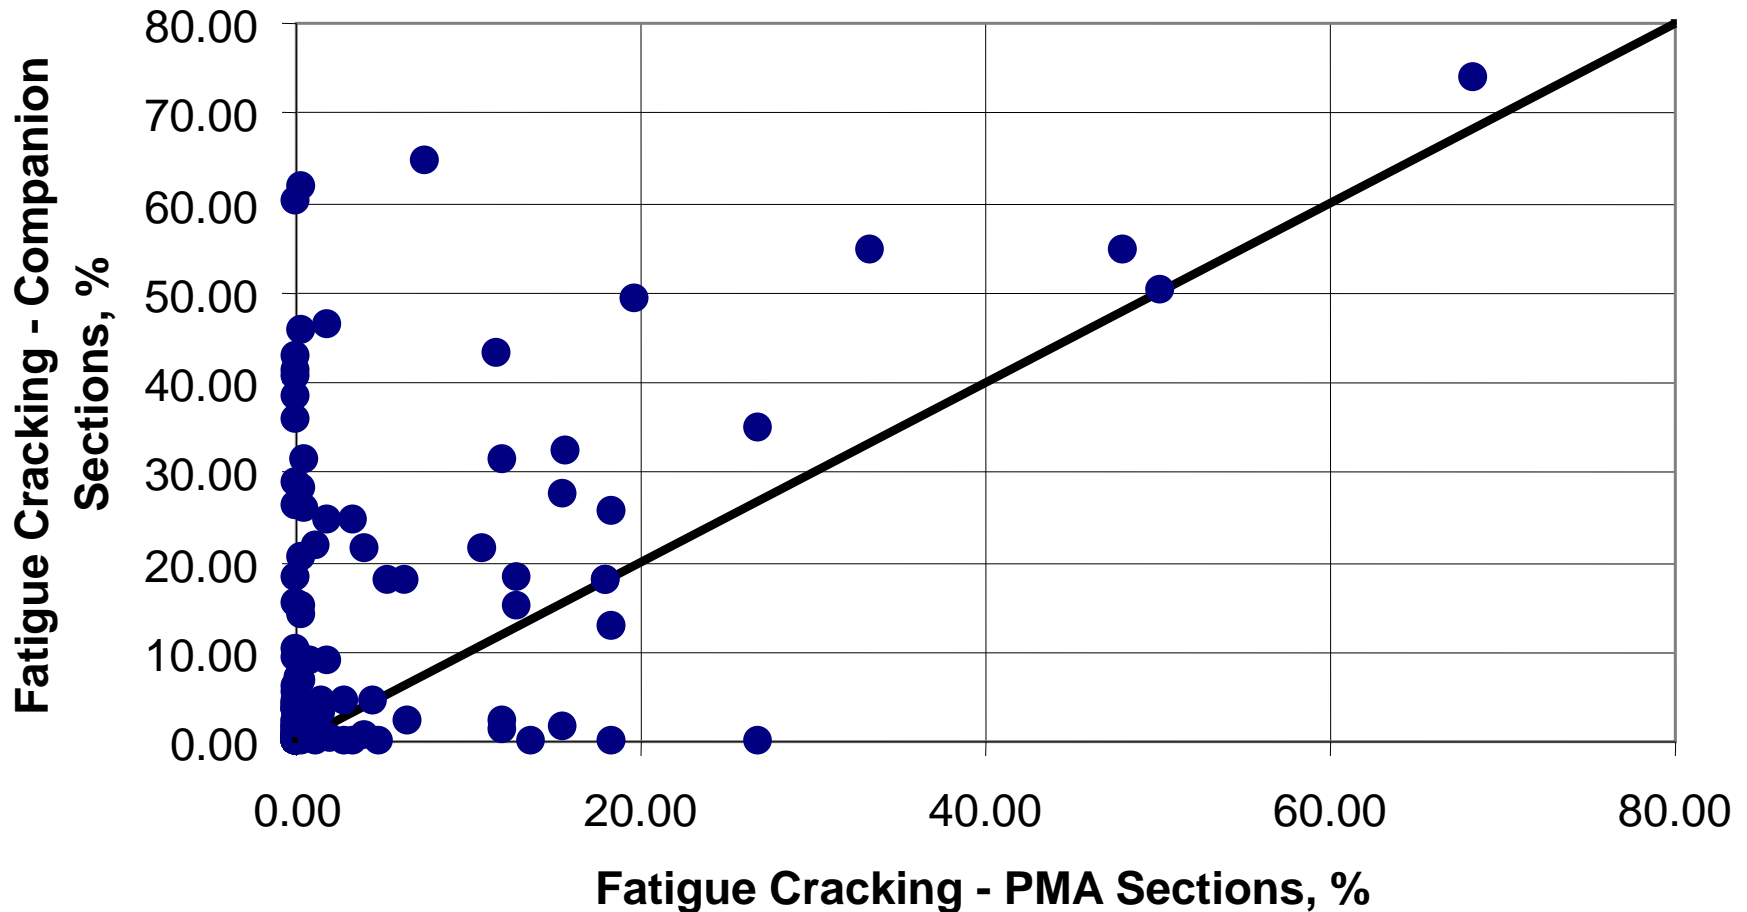

asphalt institute

# Distress Comparisons – Transverse Cracking

# Distress Comparisons – Fatigue Cracking

# When would a polymer-modified asphalt typically be used?

## AASHTO M 323 - Table 1

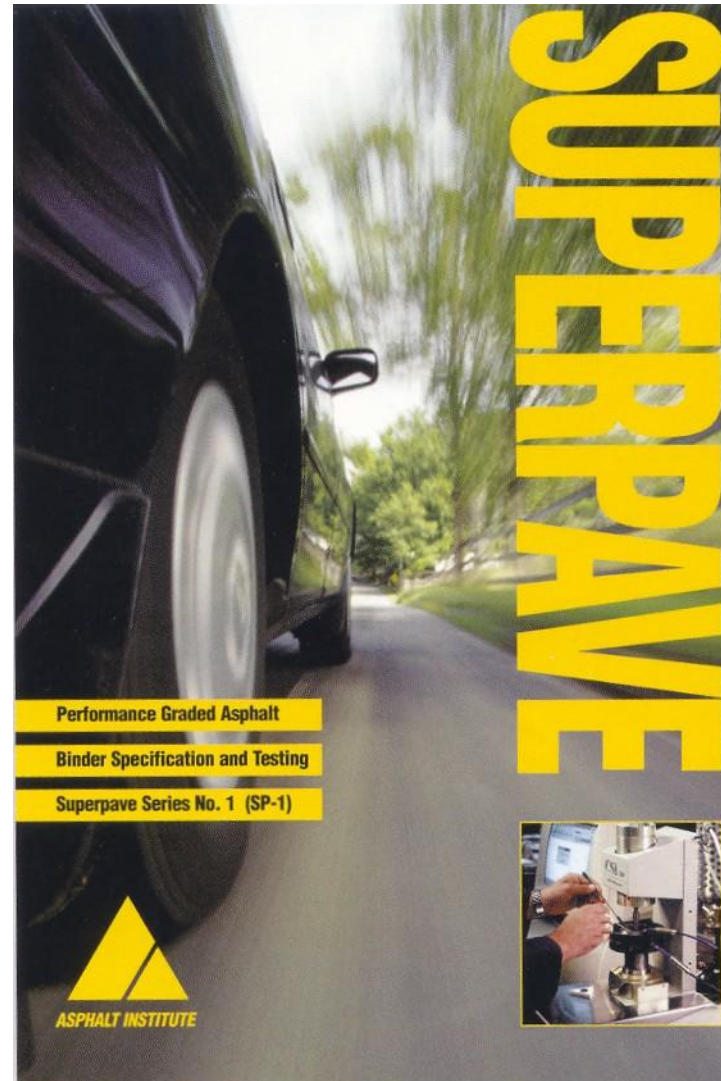

ESALs (M)	Adjustment to High-Temp Grade		
	Traffic Load Rate		
	Standing	Slow	Standard
< 0.3	-	-	-
0.3 - < 3	2	1	-
3 - < 10	2	1	-
10 - < 30	2	1	-
≥ 30	2	1	1

**\* TxDOT guidance very similar, but less structured**
